Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Oligo-nucleotide(s) which modulate vascular cell adhesion molecule expression by binding a transcription regulatory element - used to diagnose and treat atherosclerosis, restenosis or inflammatory
                                                                                                                                                                                 Claim 17; Page 34; 49pp; English.
090100-090111 bind the vascular cell adhesion molecule (VCAM)-1
gene transcriptional regulatory factor, therefore inhibiting the
expression of VCAM-1. They can be used in the diagnosis and
                                                                                                                                                                                                                                          treatment of restenosis, atherosclerosis and inflammatory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 17; Page 35; 49pp; English.
Q90100-Q90111 bind the vascular cell adhesion molecule (VCAM)-1
gene transcriptional regulatory factor, therefore inhibiting the
expression of VCAM-1. They can be used in the diagnosis and
treatment of restenosis, atherosclerosis and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

This sequence represents a probe for a interleukin-10 (IL-10) coding sequence. The IL-10 protein can be used in the method of the invention for ameliorating a symptom of: (a) septic shock in a host suffering from a bacterial (preferably gram negative) infection; (b) toxic shock; (c) infectious shock; or (d) inflammation. The method comprises administering a biologically active IL-10 (preferably human) protein, analogue or a fragment (preferably full length). The treatment is used to modulate immune responses caused by the different shock syndromes, which
                                                                                                                                                                                                      Use of interleukin-10 to modulate inflammation or T-cell mediated immune function - for treating septic and toxic shock, auto-immune diseases, tumours and infections diseases. Example B6; Page 85; 2086p; English.

Northern and Southern hybridisations were performed to determine the level at which IL-10 and IL-4 inhibit monokine production. The probe 037156 was used in Southern analysis of PCR products to detect G-CSF coding sequences. The sequence of the probe corresponds to nucleotides 400-421 of the sequence given in Nature 319; 415 1986. It was found that IL-1 alpha, IL-6, TNF alpha, GM-CSF and G-CSF expression was strongly inhibited by IL-10, and IL-4 at the mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Probe G-CSF for Interleukin-10 coding sequence.

are endotoxin or superantigen induced toxicity, or autoimmune related conditions. The conditions are side-effects of microbial infections, caused by release of their protein products, especially on anti-microbial treatment, which when cells are killed, they lyse, releasing proteins which induce the shock conditions. IL-10 inhibits TNF-alpha (tumour immune response elicits the shock syndromes: which as part of an sequence 21 BP: 3 A; 9 C; 6 G; 3 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 1: Page 15: 43pp; English.

C 45754-T45762 are probes used to determine whether or not the taforter are expressed by a human bone marrow stromal cell factor are expressed by a human bone marrow stromal into the prowth of CD34+ stem cells. The Lof(11-10) cells which support the growth of CD34+ stem cells. The Lof(11-10) cells were injected into SCID mice (previously irradiated to provide an internal space for CD34+ cells to populate). Five to seven days after 3 weeks, human CD34+ cells to poulate). Five to seven days after 3 weeks, human CD34+ cells were found in the bone marrow of the mice. The immortalised bone marrow stem cells create a human corresponding human cytokines in the animals to provide corresponding models created by administering Lof(11-10) cells are considered to study and determine the effectiveness of therapies against created by administering Lof(11-10) cells are considered by administering L

Oligo-nucleotide(s) which modulate vascular cell adhesion molecule expression by binding a transcription regulatory element - used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA encoding Staphylococcus aureus broad spectrum adhesin - for production of recombinant adhesin for use in vaccines Example 7; Column 7; 30pp; English.

Example 8; Tab Pulmers respectively contain BamHI and Sali cleavage sites. The Primers respectively contain BamHI and Sali cleavage sites of plasmid poE30 to generate vector the BamHI/SalI cleavage sites of plasmid poE30 to generate vector the BamHI/SalI cleavage sites of plasmid poE30 to generate vector staphylococcal MHC II analogue protein in transformed host (pref. E. coli) cells for use in vaccines against staphylococcal
                                                                                                                                                                                                                                                                           Claim 17; Page 35; 49pp; English.
090100-090111 bind the vascular cell adhesion molecule (VCAM)-1
gene transcriptional regulatory factor, therefore inhibiting the
expression of VCAM-1. They can be used in the diagnosis and
treatment of restenosis, atherosclerosis and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16-NOV-1997 (first entry)
Staphylococcal MHC class II antigen analogue gene primer ZPCR9.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 4; Page 30; 54pp; English.

Administration of antisense or triplex forming oligonucleotides
which bind polypurine tracts (PPT) may be used in the therapy or
treatment of individuals infected with retroviruses or hepadna
viruses since in these two families of viruses, two primers are
involved in the reverse transcription of viral RNA into double
stranded DNA, one of which is a PPT. The antisense or triplex
complementation by binding to the PPT primer or by binding to PPT
reacts in the RNA-DNA hybrid molecule formed after reverse
transcription of the viral RNA. This oligonuclectide was incubated
with an in vitro transcribed 5' and labelled pxJ2 RNA of 134
nuclectides in length to which a 40-mer decoxylbonuclectide
complementary to the PPT had been hybridised. The presence of this
sequence led to protection of the pxJ2 RNA hybrid from RNase H
digestion which would suggest the formation of a triplex. Triplex
formation was confirmed using a primer extension technique. A
primer binding downstream of the PPT was synthesised and extended in
vitro by reverse transcriptiase in the presence of
coligodeoxynuclectides including one which was radioactively labelled.
The newly synthesised DNA was terminated at the site of the PPT when
the triplex was formed and blocked extension. Triplex formation
the triplex was formed and blocked extension. Triplex formation
the triplex was formed and blocked extension. Triplex formation

Sequencing complex genomes, present as fragments in a cosmid
library - by sequencing end-specific nucleotides of each clone
then correlating with spatial relationship of cosmid, esp. for
                                                                                                                                        mammalian chromosomes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Administration of antisense or triplex forming oligonucleotides which bind polypurine tracts (PPT) may be used in the therapy or treatment of individuals infected with retroviruses or hepadna viruses since in these two families of viruses, two primers are involved in the reverse transcription of viral RNA into double stranded DNA, one of which is a PPT. The antisense or triplex forming oligonucleotides can inhibit the early stages of viral replication by binding to the PPT primer or by binding to PPT reacts in the RNA-DNA hybrid molecule formed after reverse tracts in the RNA-DNA hybrid molecule formed after reverse transcription of the viral RNA. This oligonucleotide was incubated with an in vitro transcribed 5' end labelled pkJ2 RNA of 134 unlectides in length to which a 40-mer decoxyribonucleotide in unlectides in length to which a 40-mer decoxyribonucleotide complementary to the PPT had been hybridised. The presence of this sequence led to protection of the pKJ2 RNA-DNA hybrid from RNASE H digestion which would suggest the formation of a triplex. Triplex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            vitro by reverse transcriptase in the presence of oligodeoxynuclectides including one which was radioactively labelled The newly synthesised DNA was terminated at the site of the PPT when the triplex was formed and blocked extension. Triplex formation would be expected to interfere with viral replication in vivo. See Q45381-Q45417. This is a variant of the sequence described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                formation was confirmed using a primer extension technique. A primer binding downstream of the PPT was synthesised and extended in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-SEP-1995 (first entry)

Polynucleotide encoding bcl.x(L)/bcl-2 associated death promoter - useful to treat neoplasia and apoptosis and to identify agents inhibiting its binding to bcl.2 or bcl.x(L) to form heteromultimers claim 11; Page 104; 130pp; English.

The sequences given in T29454-77 represent fragments derived from the murine bcl.x(L)/bcl.2 associated death promoter (Bad) gene (See claim 129479). Bad is a 22.1 kD protein which interacts with bcl.2 and bcl.x proteins and regulates cell death. It has homology to the bcl.2 celated family clustered in the BH1 and BH2 domain. Bad has been found to hybridise to bcl.x(L) and bcl.2 in yeast two-hybrid assays and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of bcl.x(L). Bad expression can accelerate apoptotic cell death induced by cytokine deprivation in an IL-3 dependent cell in expressing bcl.x(L), and its also counters the death repressor activity of bcl.x(L). Bad competes with Bax for binding to bcl.x(L). Competes which inhibit its binding to bcl.x(L). Competes which inhibit inhibit its binding to bcl.x(L). Competes which inhibit inhibit its binding to bcl.x(L). Competes which inhibit i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bad CDNA fragment, bases 471-499.

Example 4: Page 80: 128pp; English.

Sequences were determined from the ends of chromosome ll-specific cosmids by automated sequencing without intermediate subcloning.

A sample of 371 DNA sequence fragments were determined and of these, 277 were sultable for 375 primer prediction by computer analysis (using the "Primer" program available from E. Lander, MTT).

The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome ll were generated and most of them were cell hybrid procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping method is useful for the completion of thigh density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones.

M.D., Ph.D. CDNA Library Preparation: M. Bento Soares, Ph.D. CDNA Library Arraying: Greg Lennon, Ph.D. CDNA Library Arraying: Greg Lennon, Ph.D. DNA Sequencing by: Washington University Genome Sequencing Center Clone distribution: NCI-CGAP clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at:
                                                                                                                                                                                                                                                                          polylinker; Site_1: Not I: Site_2: Eco RI: 1st strand cDNA was prepared from 12 pooled bulk tumor samples and primed with a Not I: -01go(dT) primer. Double-stranded cDNA with a Not I: -01go(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pr773 vector. Library went through one round of normalization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Saccharomyces cerevisiae

double-stranded cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library constructed by Bento Soares and M.Fatima Bonaldo. RNA from 4 multiple sclerosis lesions from one patient was kindly provided by Dr. Kevin G. Becker (NINDS/NIH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /clone="IMAGE:276761"

The yeast genomic DNA carrying the transposon was excised from pHSS6 and transplaced back onto the yeast chromosome. Yeast colonies expressing lacz were screened for in a color assay. A plasmid containing the genomic DNA/lacz fusion junction was recovered from each individual yeast colony that expressed lacz activity. These recovered plasmids comprise 'The blue guys library'. The fusion junction was then sequenced to identify the expressed ORF upstream of the fusion."

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo (N-Soares4). "

Sequence 34, Application US/08410654B
Patent No. 5833976
GEMERAL INFORMATION:
APPLICANT: Rene de Waal Malefyt
APPLICANT: Anne O'Garra
APPLICANT: Anne O'Garra
APPLICANT: Hergen Spits
TITLE OF INVENTION: Use of Interleukin-10 to Treat
TITLE OF INVENTION: Septic Shock
NUMBER OF SEQUENCES: 61
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADDRESSEE: Schering-Plough Corporation

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description

Patent No. 5849900
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Inhibition Of Viruses By Antisense
TITLE OF INVENTION: Oligomers Capable Of Binding To Polypurine-Rich Tract Of Si
TITLE OF INVENTION: Stranded RNA Or RNA-DNA Hybrids
TITLE OF INVENTION: Stranded RNA Or RNA-DNA Hybrids
NUMBER OF SEQUENCES: 42
CORRESPONDENCE ADDRESS:
ADDRESSEE: Mackiewicz & No. 5849900is
STREET: One Liberty Place - 46th Floor
CITY: Philadelphia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Patent No. 5849900
GENERAL INFORMATION:
APPLICANT: Moelling, Karin
TITLE OF INVENTION: Inhibition of Viruses By Antisense
TITLE OF INVENTION: Oligomers Capable Of Binding To Polypurine-Rich Tract Of Singl
TITLE OF INVENTION: Stranded RNA OF RNA-DNA Hybrids
NUMBER OF SEQUENCES: 42
CORRESPONDENCE ADDRESS:
ADDRESSEE: Wacklewicz & No. 5849900ris
STREET: One Liberty Place - 46th Floor
CITY: Philadelphia

Patent No. 566591

GENERAL INFORMATION:
APPLICANT: Sonenshein, Gail E.
APPLICANT: Sonenshein, Gail E.
APPLICANT: Bellas, Robert E.
TITLE OF INVENTION: Regulation of Smooth Muscle Cell
TITLE OF INVENTION: Regulation of Smooth Muscle Cell
TITLE OF INVENTION: Proliferation
NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:
ADDRESSEE: Baker & Botts, L.L.P.
STREET: The Warner; 1299 Pennsylvania Ave., N.W.
CITY: Washington
STREET: The Warner; 1299 Pennsylvania Ave., N.W.

CITY: Washington
STREET: The Warner; 1299 Pennsylvania Ave., N.W.
CUNRUTER REDABLE FORM:
MEDIUM TYPE: Floppy disk
COUNPUTER: IBM PC Compatible
OPERATING SYSTEM: DC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION NAMBER: 105/08/354,101
FILING DATE: 06-DEC-1994
CLASSIFICATION NUMBER: 10665-0134
ATTORNEY/AGENT INFORMATION:
RESISTANTON NUMBER: 16665-0134
TELEFAX: 202-639-7700
TELEFAX: 202-639-7800
INFORMATION FOR SEQ ID NO: 7:
SEQUENCE CHARACTERISTICS:
LENGTH: 20 base pairs
TYPE: nucleic acid
TYPE: nucleic acid
TYPE: nucleic acid
                   TELEFAX: 202 672 5399
TELEX: 904136
INPORMATION FOR SEQ ID NO: 3:
SEQUENCE CHARACTERISTICS:
LENGTH: 43 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
7OPOLOGY: linear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TOPOLOGY: linear

## ALIGNMENTS

a

```
Fragments of paramyxovirus haemagglutinin-neuraminidase and fusion proteins - used for preventing virus-induced cell fusion and viral spread, e.g. for the prevention and treatment of measles, mumps, canine distemper and rinderpest proteins of the prevention and treatment of measles, mumps, canine distemper and rinderpest proteins of the protein of the other being T96017) this sequence is one of a pair of PCR primers (the other being T96017) used to generate Human influenzavirus type 2 (137) chimera, which was used to determine the section of the HN fragment important for cell fusion. A novel peptide which corresponds to the HN section of the paramyxovirus is used to inhibit paramyxovirus-induced fusion of cells and the spread of the paramyxovirus to uninfected cells, i.e. to treat paramyxovirus of Newcastle disease viruses. The method is based on the rinderpest or Newcastle disease viruses. The method is based on the discovery that a fusion protein haemagglutinin/Neuraminidase complex is essential for cell fusion to occur, and that the novel peptide prevents formation of this complex. Antibodies to this complex can be sequence 20 BP; 6 A; 5 G; 5 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21-JUL-1998 (first entry)

triphosophates used as antiviral agents and synthons

Claim 177; Page 171; 259pp; English.

A method has been developed for the identification of a nucleic acid
capable of modulating a process in a biological system. The method

comprises: (a) introducing into the system a random library of nucleic
acid catalysts (NAC) having a substrate binding domain (SBD), comprising

a random sequence, and a catalytic domain (CD); and (b) identifying NAC.

in systems where modulation has occurred and/or determining the sequence
of at least part of the SBDs in such systems. Nucleic acid molecules with

confonuclease activity and catalytic activity, from the present invention,

are used to modulate gene expression in plant and mammanian cells and to

cleave target nucleic acid, particularly for trreating systemic diseases

caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
ascites and infection. They may also be used to detect genetic drift and

mutations in diseased cells and to determine c-raf RNA. Specifically NACs

with RNA-cleaving activity that modulate expression of the Raf gene, are

used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
            Example 8; page 39; 65pp; German.

V1379-V1390 are primers used in a method to construct a transgenic plant cell with altered acetyl-coenzyme A (AcCoA) hydrolase metabolism which has higher activity than wild-type cells. Controlling AcCoA hydrolase activity is used to regulate intracellular distribution of metabolites, specifically it increases concentration of acetate, leading to altered production of isopremoids, steroids, flavonoids, hormones, fats, oils, rubber, alkaloids, sugars and starch and anti-pathogenic agents. A specific application is increasing the fat content (by at least 7%) of oilseed crops, e.g. (especially) rape, soya, sunflower and oil palms, but the method can also be applied to cereals, vegetables, sugar beet, tobacco, cotton or commental plants.

BRCA2 can also be used in gene therapy to restore wild type BRCA2 gene thorthon to a cell, which has lost its or has altered (i.e. by virtue of a mutation in BRCA2) BRCA2 gene function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10-MAR-1998 (first entry)

Oligo:nucleotide(s) corresponding to human IgA segments - comprising membrane anchoring extracellular peptide segments, used to develop prods. for therapy and diagnosis Example 1; Column 15; 12pp; English. This is the nucleotide segmence of a probe used to isolate phage clones conty. the sequences encoding the alpha-1 and alpha-2 isoforms of the membrane anchoring peptide from a human IgA. The probe was used to screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human IgA membrane anchoring extracellular peptide segment probe.

We human parainfilenza virus (HPIV) clone, and - methods of clone production and introduction of site-specific mutations

Example 1; 7pp; 54pp; English.

This primer encodes the 3' end of a hepatitis delta virus
antigenomic ribozyme and a BglII site. It was used with a second primer (see V70404), which contains a sequence from the 3' untranslated region of human parainfluenza virus type 3 (HPIV-3); contranslated region of human parainfluenza virus type 3 (HPIV-3); contranslated region of the manifilenza virus type 3 (HPIV-3); contranslated region of the ribozyme. The product was used in the CV70404), and which also primes synthesis of the ribozyme, in the PCR amplification of a full-length cDNA clone of HPIV-3. The invention relates to a system for generating recombinant HPIV such as a clone comprising a nucleotide sequence that encodes a full-length, positive sense, anti-genome of HPIV. The invention also relates to a method of preparing recombinant HPIV clones enables analysis of HPIV transcription and replication in a cell-free system. A system which permits production of recombinant HPIV that is
                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This sequence represents an oligonucleotide which corresponds to a sequent located in the CH3 coding region of immunoglobulin allotype alphal and alphal and was synthesised and used as a probe to screen phage clones containing oil or alphal gene segments. The library was constructed using genomic DNA from human lung fibroblast line, W138, packaged in phage FIX. The invention relates to a unique extracellular peptide segment present on B cell bound but not secreted IgA. These extracellular peptide segment bound but not secreted IgA, and thereby provide a unique to membrane bound but not secreted IgA, and thereby provide a unique to membrane bound but not secreted IgA, and thereby provide a unique epitope on the IgA-bearing B cells to which membrane bound IgA and IgA-bearing B cells.

                                                                                                                                                                                                                                         ö
a human lung fibroblast line library in the phage FIX. The sequences encoding the extracellular portion of the membrane anchoring peptide (R88191) can be used to raise antibodies against the IgA membrane extracellular peptide which can modulate IgA synthesis, esp. to increase their prodn. The peptides and antibodies can be used to treat or in the prophylaxis of infectious diseases, allergies and immunodeficiency

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          risolated protein targetting to glycogen genes - used to develop products for increasing glycogen levels in cells and to develop products for increasing glycogen levels in cells and to develop animal models for the study of e.g. diabetes

Disclosure; Page 30; 71pp; English.

CR primers (V21466 and V21467), which contain BamHI and KpnI sites, respectively, were used to amplify a 2.0 kb region 5′ to the coding region of the gene (see V21462) coding for murine protein coding region of the gene (see V21462) coding for murine protein (see W34164). PTG is a novel glycogen binding subunit of PPIC that is expressed predominantly in insulin-sensitive tissues and which mediates the hormonal control of glycogen accumulation in intact cells. A PTG knockout vector was constructed. A mouse having its PTK gene deleted from its genome is claimed. Such knockout mice are useful as animal models model.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide for treating hypertension - contains aminoacid sequence based on aspargine, proline, methionine, tyrosine, alanine, serine, leucine, lysine, histidine, etc.
